

LaTeX to PDF Quick Guide

To compile a LaTeX file into a PDF, use the `pdflatex` command:

```
pdflatex sample.tex
```

This produces `sample.pdf` in the same directory.

For documents with bibliographies or cross-references, run `pdflatex` twice.

You can also use `latexmk` for automated builds:

```
latexmk -pdf sample.tex
```

The `latexmk` tool reruns `pdflatex` until references stabilize.
